

Heparin decay nomogram — Lanoiselée

Reference model: Lanoiselée. $k = 0.00703$ /min (apparent half-life 99 min). Monte Carlo sampling interval 0.00703-0.00703.

grid_snapped_70_15_60: 400 IU/kg, prime 5000 IU, IBW 70+/-10 kg, time to CPB 15+/-3.75 min, time on CPB 60+/-15 min [adult]

Seed 20260912. Commit b4e20c8. core 2.0.0

Research and educational instrument. Reading the residual load requires no calculation; converting it to a protamine dose requires the institutional ratio.

This printed chart carries no uncertainty band: the elapsed-time axis is spaced for this one decay constant, so a different constant is a different chart rather than a wider line. The interval above is Monte Carlo sampling
